ON APPLICATION / USAGE OF THE PRODUCTS

Although our products are designed on the basis of our profound knowledge and long experience, and manufactured under the strict quality control system, the following must be taken into consideration in actual use.

1

The operating conditions of the products shown in this catalog vary depending upon each application. Therefore, the decision of the products' suitability to the system considered must be made by the designer of the hydraulic system and/or the person in charge of determining the specification after making analysis and conducting tests, if necessary. The study of the specification shall be done based on the latest catalog and technical documents, and the system must be composed taking into account situations regarding the possibility of machine failure.

2

Prior to use of the products, descriptions given in the SAFETY PRECAUTIONS must be observed for the proper use.

3

The technical information in this catalog represents typical characteristics and performance of the products, and is not guaranteed one.

4

In case the products are used in the following conditions or environments, please consult us prior to the use.

- ① Unspecified conditions or environments
- ② Use for atomic power, aviation, medical treatment, and/or food
- ③ Use likely to affect human beings or assets significantly or requiring particular safety

5

The information described in this catalog is subject to change without notice. For updated information, please consult us.

SAFETY PRECAUTIONS

Before you use the product, you **MUST** read the operation or operators manual and **MUST** fully understand how to use the product.

To use the product safely, you **MUST** carefully read all Warnings and Cautions in this manual. You **MUST** also observe the related regulations and rules regarding safety.

■Cautions related to operation

- ①  **CAUTION** Use the safety equipment to avoid the injury when you operate the product.
- ②  **CAUTION** Pay enough attention on handling method to avoid pinching hands or back problems that may be caused by heavy weight of the product or handling posture.
- ③  **CAUTION** Do not step on the product, hit it, drop it or give strong outside force to it, as one of these actions may cause the failure of work, damage or oil leakage.
- ④  **CAUTION** Wipe the oil on the product or floor off completely, as the oil creates slippery conditions that may result in dropping the product or injuring.

■Warnings and Cautions related to installation and removal of the product

- ①  **CAUTION** Installation, removal, plumbing, and wiring must be done by the certified person.
*CERTIFIED PERSON : a person who has enough knowledge like a person who is trained by Kawasaki's hydraulic school.
- ②  **WARNING** Make it sure that the power of the hydraulic power unit is turned off and that the electric motor or engine has completely stopped before starting installation or removal. You must also check the system pressure has dropped to zero.
- ③  **WARNING** Turn off the power before starting wiring or other works related to the electric power, otherwise you may be stuck by an electric shock.
- ④  **CAUTION** Clean the threads and mounting surface completely, otherwise you may experience damages or oil leakage caused by insufficient tightening torque or broken seal.
- ⑤  **CAUTION** Use the specified bolts and keep the specified tightening torque when you install the product. Usage of unauthorized bolts, lack of torque or excess of torque may create problems such as failure of work, damage and oil leakage.

■Warnings and Cautions for operation

- ①  **DANGER** Never use the product not equipped with anti-explosion protection in the circumstances of possible explosion or combustion.
- ②  **WARNING** Shield the rotating part such as motor shaft and pump shaft to avoid injuries caused by being caught of fingers or cloths.
- ③  **WARNING** Stop the operation immediately if you find something wrong such as unusual noise, oil leakage or smoke, and fix it properly. If you continue operating, you may encounter damage, fire or injury.
- ④  **CAUTION** Make it sure that plumbing and wiring are correct and all the connection is tightened correctly before you start operating, especially if it is the first run.
- ⑤  **CAUTION** Use the product under the specification mentioned in the catalog, drawings and specification sheet.
- ⑥  **CAUTION** Keep your body off the product during the operations as it may become hot and burn your body.
- ⑦  **CAUTION** Use the proper hydraulic oil, and maintain the contamination in the recommended level, otherwise it may not work or be damaged.

■Cautions related to maintenance

- ①  **CAUTION** Never modify the product without approval of Kawasaki.
- ②  **CAUTION** Do not disassemble and assemble without approval by Kawasaki. It may cause troubles and failure, or it may not work as specified. If it is necessary by all means to disassemble and assemble, it must be done by an authorized person.
- ③  **CAUTION** Keep the product from dust and rust by paying attention to the surrounding temperature and humidity when you transport or store the product.
- ④  **CAUTION** Replacing the seals may be required if you use the product after long time storage.

This catalog introduces motors for general use. (Colored in in the above table.)

FEATURES

1. Wide variety variation

- Fixed Displacement Motors

M3X series consists of 4 models and 10 displacement types ranging from 149cm³ to 800cm³. M3X with reduction gear series covers a displacement range from 845cm³ to 5,120cm³. K3X series is made up of 4 models with displacement range from 63cm³ to 111cm³.

- Variable Displacement Motors

M3B series consists of 4 models with displacement range from 195cm³ to 800cm³ and from 1,512cm³ to 5,120cm³ for those with reduction gears. Several combinations of large and small displacements are available along with a wide variation of regulators are also available for various control options.

2. Excellent self-priming capability and max. speed (M3X, M3B, K3X)

- A spherical surface type valve plate and full-balancing mechanism enhance self-priming capability and max. speed.

3. High reliability based on long experience (M3X, M3B)

- Building on the knowledge and experiences of reputed MX/MB series, M3X/M3B series have been widely used especially as winch motors.

4. Optional parts (M3X, M3B)

- Built-in parking brake is available for M3X/M3B motors.
- Various control valves are available for M3X/M3B motors.

5. Other motors

- M2X/M5X series motors are specifically designed for swing function of construction machinery.
- MCB series plug-in motors and DNB series case rotating type geared motors are available for traveling construction machinery.
- Low speed, high torque radial piston motors are prepared for general industrial use.

M3X Series

M3B Series

M3X/M3B-RG Series

M3X Series

The M3X series are newly developed motors for construction machinery, industrial machinery or other applications.

The design based on technology and experience of current MX series is more compact and enables a speed range.

FEATURES

1. Advanced Low Speed Characteristics

New design which reduces pressure ripple and friction enabling expanded lower speed limit and smooth starting characteristics.

2. High Speed Operation

New materials enable an increase in the maximum speed which has 1.5 times of current MX series.

3. Best Fit

4 models and 10 capacity motors are carried in 149-800 cm³. Installation is the same as current MX series. Larger capacity is possible with reduction gears RG series. (Refer to page 23)

CALCULATION FORMULA

■ required input flow L/min

$$qv = \frac{Vg \cdot n}{1,000 \cdot \eta v}$$

■ output speed min⁻¹

$$n = \frac{qv \cdot 1,000 \cdot \eta v}{Vg}$$

■ output torque N·m (kgf·m)

$$T = \frac{Vg \cdot \Delta p \cdot \eta_{hm}}{2 \cdot \pi}$$

■ output power kW (PS)

$$P = \frac{2 \pi \cdot T \cdot n}{60,000} = \frac{T \cdot n}{9,550}$$

$$= \frac{qv \cdot \Delta p}{60} \cdot \eta_t$$

● BEARING LIFE

■ The calculated life (B₁₀ life) shown in the graph is for speed

$N_0 = 1,000 \text{ min}^{-1}$

Calculation of life for a random speed N is as follows.

$$L = \frac{N_0}{N} \times L_0 \quad (L_0 : \text{calculated life for } N_0)$$

◆ M3X Front bearing life

◆ M3X Rear bearing life

(Note) p_1 : inlet pressure p_2 : outlet pressure

● RADIAL LOAD

■ In case that radial load is applied, you are requested to install the motor so as to place the radial load toward the arrow direction shown in below. Please refer to the relevant list of each motor for allowable radial load.

(Note1) The mechanical brakes of M3X/M3B series shall be used for parking only so please make sure not to apply the brakes when motors are driving.

(Note2) In case of low pressure release type, brake release shall be conducted by providing hydraulic oil pressured more than stroke end pressure and less than 7.8 MPa (80kgf/cm²)

Please note that effective pressure is the differential pressure between brake release and drain.

(Note3) In case of motors with H6-B as brake model code, release pressure is provided from traveling counterbalance valve, and the brake is automatically released.

M3B Series

The M3B Series are variable displacement type motors with the same rotary components of M3X Series which enable the advanced low speed characteristic and high speed operation.

The design of various displacement control is based on current MB Series. The range of displacement is 100%–33% with 3 types of various displacement control regulators. Electric displacement control is also possible.

FEATURES

1. Advanced Low-Speed Characteristics

New design which reduces pressure ripple and friction enabling expanded lower speed limit and smooth starting characteristics.

2. High-Speed Operation

New materials and enlargement of variable displacement range have enabled the higher maximum speed. The ratio of large to small displacement is enlarged from 2 (old model/MB series) to 3.

3. Various Displacement Control Regulator (3 Type)

- A: Directional control valve
- B: Sequence control regulator
- C: Speed & CHP control regulator (Refer to next page)

4. Electric Displacement Control

The pilot pressure can be controlled by a solenoid-operated directional control valve or a pressure-reducing valve.

◆ Regulator

A : Directional control valve

Shifts displacement small or large by remote control signal.

B : Sequence control regulator

Automatically shifts displacement small or large depending on the load.

C : Speed & CHP control regulator

Maintains constant horsepower regardless of the load. Controls displacement at any position by pilot pressure. The pilot pressure can be controlled by a solenoid-operated directional control valve or a pressure-reducing valve.

CHP : Constant horsepower

REGULATORS

Pilot Control

code	control type	control curve	function & features
1	two position negative displacement shifts (pressure control type)		Two prior set displacements are shifted negatively by varying pilot pressure. Hydraulic pressure from 2.5 to 5.0 MPa shall be provided as pilot pressure.
2	two position negative displacement shifts (elctorical control type)		Two prior set displacements are shifted negatively by varying voltage. Hydraulic pressure from 2.5 to 5.0 MPa shall be provided as pilot pressure.
3	two position negative displacement control		Displacement is determined between two prior set volumes in inverse proportion to electric current. Hydraulic pressure from 4.0 to 5.0 MPa shall be provided as pilot pressure. Standard set conditions: ① 356mA (1.2 MPa), Vg,1 (100%) ② 644mA (3.5 MPa), Vg,2 (33%)
4	three position negative displacement control		Displacement is determined among three prior set volumes in inverse proportion to electric current. Hydraulic pressure from 4.0 to 5.0 MPa shall be provided as pilot pressure. Standard set conditions: ① 319mA (0.9 MPa), Vg,1 (100%) ② 393mA (1.5 MPa), Vg,x (50%) ③ 581mA (3.0 MPa), Vg,x (50%) ④ 626mA (3.4 MPa), Vg,2 (33%)
5	two position positive displacement shifts (elctorical control type)		Two prior set displacements are shifted positively by varying voltage. Hydraulic pressure from 2.5 to 5.0 MPa shall be provided as pilot pressure.
6	two position positive displacement control		Displacement is determined between two prior set volumes in proportion to electric current. Hydraulic pressure from 4.0 to 5.0 MPa shall be provided as pilot pressure. Standard set conditions: ① 100mA (3.5 MPa), Vg,2 (33%) ② 509mA (1.2 MPa), Vg,1 (100%)
7	three position positive displacement control		Displacement is determined among three prior set volumes in proportion to electric current. Hydraulic pressure from 4.0 to 5.0 MPa shall be provided as pilot pressure. Standard set conditions: ① 156mA (3.4 MPa), Vg,2 (33%) ② 244mA (3.0 MPa), Vg,x (50%) ③ 469mA (1.5 MPa), Vg,x (50%) ④ 539mA (0.9 MPa), Vg,1 (100%)

Automatic Control

code	control type	control curve	function & features
a	without automatic control	—	—
b	sequence control		During small displacement operation, when the load increases and the pressure reaches to a certain point, the motor shifts into large displacement operation. Since then the motor maintains the large displacement operation until the pressure declines to a certain point. Standard set conditions: p_2-1 = 25 MPa, p_1-2 = 4.3 MPa
c	constant horsepower control		Displacement varies in order to maintain the pressure in line with the load. The motor maintains small displacement operation until the pressure increases to a certain point, and then shifting into a large displacement operation. Standard set conditions: p_2-1 = 25 MPa

(Note1) The regulator in M3B motor operates choosing the higher pressure port between A and B port. If the servo pressure does not hold more than 2 MPa, servo pressure must be provided.

If you need to shorten the time of shifting displacement, proper servo pressure must be provided. (Refer to below fig.)

(Note2) Pilot control section in M3B motor controls pilot second pressure negatively.

Negative displacement control of Code No.2-4 may be conducted by providing pilot second pressure directly without using solenoid operated switching valve or solenoid operated proportional valve.

(Note3) Small displacement instruction must be provided on the pilot control side before using automatic control operation. Automatic control operation precedes pilot control operation.

(Note4) The automatic controller of Code No. b and c operates choosing the higher pressure port between A and B port.

The regulator operated by the differential pressure p_1-p_2 is also available as optional function and if necessity arises, please contact us.

Tilting time, pressure related

Solenoid operated switching valve specifications

max. pressure	13.7MPa
rated voltage	DC24V
rated consuming electric power	≤ 17W (24V, 20°C)
standard connector	Mitsubishi Cable Co., Z02M-GY (2P)

connector shape

Solenoid operated proportional valve specifications

max. pressure	13.7MPa (3.9MPa in case of inverse proportion)
rated electric current	700mA
recommended dither power	80Hz/200mA _{P-P}
coil resistance value	17.5Ω (20°C)
standard connector	Mitsubishi Cable Co., Z02M-GY (2P)

M3B200 Regulators

M3B280, 530, 800 Regulators

VARIOUS VALVES to CONTROL MOTORS

Various control valves, attachable direct to flanges of M3X/M3B series, are available.

(Note) Some combinations of motors and valves need conversion plates.

Swing control valve

KSC

◆KSC19

Swing control valve of neutral free type.

Valve specifications

max. pressure	30.9MPa (315kgf/cm ²)
rated flow	200 L/min
set pressure range of main relief valve	14.7~30.9MPa (150~315kgf/cm ²)
allowable back pressure	1.5MPa (15kgf/cm ²)
pilot pressure	0.29~2.51MPa (3~25.6kgf/cm ²)

Counter balance valve for driving

B

Built-in shock-less relief valve enables smooth deceleration. This valve also automatically releases negative break in motor.

◆ B25C

Applicable to M3X/B 530, 800

Valve specifications

rated flow	240 L/min
max. flow	350 L/min
max. pressure	30.9MPa (315kgf/cm ²)
set pressure of relief valve	Ps=30.9MPa (315kgf/cm ²)
spool shifting pressure	cracking : 0.91MPa (9.3kgf/cm ²) reset : 0.78MPa (8.0kgf/cm ²)

◆ B35C

Applicable to M3X/B 530, 800

Valve specifications

rated flow	380 L/min
max. flow	500 L/min
max. pressure	34.3MPa (350kgf/cm ²)
set pressure of relief valve	Ps=36.3MPa (370kgf/cm ²)
spool shifting pressure	cracking : 0.78MPa (8.0kgf/cm ²) reset : 0.69MPa (7.0kgf/cm ²)

Flushing valve

FV

This valve charges the low pressure port with working oil in closed circuit and prevents rise in temperature of the working fluid.

◆ FV30

Valve specifications

max. pressure	37.8MPa (385kgf/cm ²)
max. flow	275 L/min
set pressure of high pressure relief	34.3MPa (350kgf/cm ²)
set pressure of low pressure relief (at 70L/min)	1.8MPa (18kgf/cm ²)
spool shifting pressure	2.0MPa (20kgf/cm ²)

Check valve block

VB

This valve prevents cavitation.

◆ VBS-199

Valve specifications

max. pressure	34.3MPa (350kgf/cm ²)
max. flow	780 L/min
cracking pressure of check valve	0.03MPa (0.3kgf/cm ²)

mass	kg	98	150	243	420

■ Max. pressure and Max. speed are determined by RG specification. Please make sure the temperature of the RG shall not rise beyond 80°C.

■ If the motor is used for the short operating periods such as used as winch motor and so on, the operating conditions may be beyond the rated pressure or max. speed mentioned above.

In this case please inform us of the specific operating conditions.

■ The theoretical radial force W acting on the driving shaft is calculated by the following formula.

$$W = \frac{2 \times T \times 10^3 \text{ N}}{m \times Z \times \cos \alpha}$$

T : theoretical output torque N·m
 m : module mm
 Z : number of teeth
 α : standard pressure angle of cutter deg.

■ Allowable theoretical force shown in the table depends on the distance of load center from mount flange.

● BEARING LIFE

■ The life obtained in this graph is for the speed of 50 min⁻¹ and the load point of $\varnothing$ (spline center)

(Note 1) The bearing life is in inverse proportion to the speed.

(Note 2) If $\varnothing$ is larger, the bearing life becomes shorter.

Other caution

(Note 1) The life of the gears is influenced by the operating pressure.
Please consult us, if necessary.

(Note 2) Use gear oil equivalent to GL-3 or GL-4 of API classification.

K3X Series

The K3X series are newly developed motors for industrial machinery.

The design is based on technology and experience of current K3V series for construction machinery or industrial machinery.

FEATURES

1. High Efficiency and Reliability

K3X series has high efficiency and high reliability by using common rotary parts of K3V Series pumps which are used widely for construction machines and have many years of experience.

2. Allowable to Apply The Radial Force

The motor shaft can withstand radial loads. But in this case, bearing life decrease.

3. Allowable to Use on Upward Motor Shaft Position

The motor has the drain port to be installed with shaft vertical.

Idle & boost-graph

Shaft creep speed

Radial load and bearing life

Bearing life

The calculated life (B₁₀ life) shown in the graph is for speed No=1,000min⁻¹. Calculation of life for a random speed N is follows.

$$L = \frac{N_0}{N} \times L_0 \quad (L_0 : \text{calculated life for } N_0)$$

(Note)
p1: inlet pressure
p2: outlet pressure

Front bearing life

Rear bearing life

■ OPERATION PRINCIPLE

As shown in the right, the high pressure oil passes through the inlet port (a) and flows into the cylinder block (2). Hydraulic force thus acts upon the piston (4), generating an axial force F . This force F is vector-analyzed through the shoe (5) into force F_1 which is perpendicular to the swash plate (7), and force F_2 which is a vertical force with respect to the output shaft. The reaction force of force F_2 is transmitted via the piston to the cylinder block, generating a rotational force which turns the output shaft.

These are 9 equally spaced pistons in the cylinder block. The pistons connected to the high pressure inlet port transmit rotational torque sequentially to the output shaft.

Reversing the flow of operating oil causes the output shaft to rotate in reverse.

The theoretical output torque (T) is obtained by the following formula.

$$T = \frac{\Delta p \times Vg}{6.28}$$

T : Theoretical output torque N·m
 Δp : Effective pressure difference MPa
 Vg : Displacement per revolution cm³

$$1 \text{ N} \cdot \text{m} = 0.10197 \text{ kgf} \cdot \text{m}$$

$$1 \text{ MPa} = 10.197 \text{ kgf/cm}^2$$

■ PARKING BRAKE (Option)

This is a negative type, oil-lubricated, multi-disc parking brake. Friction plates are cooled and lubricated by the drain oil of the hydraulic motor. The braking operation is as follows.

The friction plates (14) which are splined to the joint (11) and the separator plates (13) which are splined to the valve cover (8) are placed alternately. If not in operation, the brake piston (10) is pushed leftward by the springs (3) and the resultant friction force between the friction and the separator plates restricts the driving shaft to rotate. On the other hand, a release pressure larger than the spring force is applied to the oil chamber (15) through the release port, the brake piston (10) moves rightward and clearance is formed between the plates. So the brake is released and the driving shaft can rotate freely.

DISPLACEMENT CHANGING MECHANISM OF M3B SERIES

◆ M3B280,530,800

The semi cylindrical slide plate, positioned at the both sides of the swash plate, supports the load, as a swash plate supporting mechanism. Two control pistons push swash plate opposite to each other. Displacement is changed by controlling the oil supply to the chambers to adjust the tilting angle of the swash plate.

◆ M3B200

The semi spherical pivot ball, positioned at the both sides of the swash plate, supports the load, as a swash plate supporting mechanism.

The tilting angle of the swash plate diminishes by supplying the oil to the chamber of a control piston positioned at the swash plate. On the other hand, when oil is not supplied to the chamber, swash plate is retreated by the forces applied to the pistons and by the cylinder spring and the tilting angle becomes maximum.

CAUTION FOR HANDLING

1. Operating fluid and temperature range

- ① Please use antiwear hydraulic fluid as operating fluid.
- ② The allowable ranges of operating fluid are as follows.
Viscosity : 10~1,000 mm²/s (cSt)
Temperature : -20~+80°C
- ③ In case of using special fluid (Phosphate ester compounds, water-glycol fluid, fatty acid ester compounds, etc.) please consult Kawasaki for instructions prior to use.

2. Filtration

For satisfactory service life of these motors application, the operating fluid should be controlled cleaner than the cleanliness level of NAS1638 Class9. Install a 10 μm filter in the return circuit of respective actuators.

3. Mounting

- ① Regarding the mounting direction, please refer to the below list. In case of the "Option" mentioned in the list, please consult Kawasaki.
- ② Kawasaki.

Alignment should be so carried out that the parallel error may be held within ±0.05 mm.

Direction of the shaft	M3X/M3B	M3X/M3B-RG	K3X
Horizontal	Standard	Standard	Standard
Down ward	Option	Option	Option
Up ward	—	—	Standard

4. Drain piping

- ① The motor's drain port, as shown in the following figure, should be so located that the casing can be filled with oil.
- ② Use a drain tube bigger in size than the motor's port. Keep the casing pressure normally below 0.2 MPa (2 kgf/cm²) and below 0.6 MPa (6 kgf/cm²) even at the peak.

WARNING

5.Oil filling and air venting

Before operation, be sure to fill the casing with oil through the drain port . Vent all air out of the motor and hydraulic circuit prior to operation.

The insufficient amount of oil may cause the lubrication failure, resulting in the seizure of internal parts. The volume of the oil is shown in the SPECIFICATIONS as case volume.

WARNING

6.Parking brake

This brake should be used only for parking, are not for dynamic braking. In case of driving inertial load, measures such as the adoption of the time delay valve should be taken to prevent the parking brake from being activated before the inertial mass stops.

WARNING

7.Radial and thrust load

- ① Bearing life against the radial load applied to the shaft is shown in the Performance curve for each motor type. If load point or load direction is different, please consult us.
- ② Do not apply thrust load to the shaft of these motors.
- ③ Radial and thrust load may be applied to the output shaft of the reduction gears. Please refer to P23 for the relations between the radial load and the bearing life.

CAUTION

8.Cavitation

When the motor is operating in an overrunning (pumping) mode, then to prevent the occurrence of cavitation, a positive boost pressure is required at the suction port. The minimum boost pressure requirement shown in the model performance data is based on the regular operation. In case of a rapid change of the flow volume, more boost pressure must be applied.

CAUTION

9.Back pressure

The lower of the two main motor ports pressures should always be less than 2.5 MPa (25 kgf/cm²). Pressure higher than this could cause a possible reduction in motor performance. In case of any doubt please consult us.
